

CI/CD Workflow for Selenium Automation Testing

Objective

To execute Selenium automation tests automatically whenever code changes are pushed to the repository.

Trigger

The pipeline starts when:

- Developer pushes code to GitHub
- Pull Request is created
- Manual execution is requested

Pipeline Steps

1. Source Code Checkout
2. Download latest code from GitHub
3. Build Application
4. Install project dependencies
5. Execute Selenium Tests
6. Run automated Selenium test scripts
7. Generate Test Reports
8. Create TestNG/HTML reports
9. Publish Results
10. Store reports as artifacts
11. Deployment Decision
12. If all tests pass → deployment continues
13. If tests fail → deployment stops

Benefits

- Faster testing
- Early bug detection
- Reduced manual effort
- Improved software quality
- Continuous feedback

Expected Output

- Test Execution Status
- Pass/Fail Summary
- Test Report
- Build Logs
